

IN THE SPECIFICATION

Please amend the paragraph at page 4, lines 25-31, as follows:

Thus, the first connecting piece 14 comprises a first element 14a which has a conical surface that mates with the shape of one of the conical parts 11, 12 of the hole and a cylindrical part which enters the cylindrical part 13 of the hole without extending as far as the opposite face. This cylindrical part preferably has a diameter smaller than that of the cylindrical part of the hole. The element 14a has, passing through it, a conical bore [[16]], the function of which will be explained later on in the text.
